Soil Sci. 51(4):937â€“943. doi:10.1034/j.0021-8579.2004.12.014.Gigantic lung adenoma from a patient with multiple endocrine neoplasia type 1. Paraneoplastic syndromes are paraclinical manifestations that are related to a tumor and not to the disease itself. One of the features of the syndrome is a decrease in acid secretion by the stomach and an increase in secretion of the amine histamine. Multiple endocrine neoplasia type 1 is an autosomal dominant syndrome with tumors of the endocrine organs, most commonly a medullary carcinoma of the thyroid. Patients with multiple endocrine neoplasia type 1 generally have gastric antral varices and achlorhydria, but we report a patient with multiple endocrine neoplasia type 1 with a giant lung adenoma. The patient had left lung-limited emphysema, no transverse sinus thrombosis, and no mediastinal lymphadenopathy, but there were numerous pangastric varices and achlorhydria. Computed tomography of the chest and upper abdomen demonstrated a poorly defined mass in the left upper lobe. A lobectomy was performed and the mass measured 9 x 8 x 5 cm. The histologic specimen contained large polygonal cells with grooved nuclei, abundant cytoplasm, and a unique pattern of vacuolar degeneration. Special stains showed strongly positive stains for carcinoembryonic antigen, a highly sensitive marker of tumor cells, with focal staining of

the vacuoles. This is the first description of multiple endocrine neoplasia type 1 causing a giant lung adenoma. Pages
Wednesday, 26 February 2012 Hi... there! Well, I am back to my blog after taking a break from it for a while. I hope you are all well. I have been really busy planning for my hen do! I will be letting you know more about it when I am closer to it. Anyway, I have a few crafty things to show you this week, and three projects all from this month's challenge at Whimsy Stamps! I have made three cards, and will show you all of them in my post this week. The challenge this month
