JETSTREAM is available for free at the official site. The user interface is basically identical, but the game engine and the engine's programming code is a bit different. The original version of Jetstream is written in Java, and it was originally developed by Alexandr Melnikov. His own development studio, Metallurg, has now released Jetstream as freeware. The game is now maintained by an open source community with the name Open Jetstream. The game was ported to be 100% open source by its community. Its 1.1 version in 2015 is available at the open source game repository Github. Jetstream is the only game which uses the Glacier2 engine for Android. Gameplay Jetstream is an action RPG, where the player fights hundreds of enemies using various weapons, including a jetpack and various types of weapons. Plot The game is set in a dystopian future, where the Earth has been controlled by the evil MEGACORP corporation. The player takes the role of Sam, an indentured slave who is about to be deactivated, when the CEO of MEGACORP, Peter Rhodes, meets with the group of revolutionaries who are trying to overthrow the corporation. After the demo starts, the player is given the option to play the main campaign for free (as a test), or for just five cents. The latter option unlocks a bonus campaign. Reception Nix.js praised the game for its gameplay, graphics and voice acting, while stating that it had problems with user interface design. The game has a rating of 4.5 out of 5.
